VMware vSphere Delivers Essential Services for the Modern Hybrid Cloud

vSphere 7 delivers essential services for the modern hybrid cloud. The new vSphere has been rearchitected with native Kubernetes to run existing enterprise applications alongside modern containerized applications in a unified manner.

vSphere 7 with Kubernetes, available through **VMware Cloud Foundation**, delivers VMware Cloud Foundation Services and application-focused management for streamlined development, agile operations, and accelerated innovation. Applications can be deployed using any combination of virtual machines, containers, and Kubernetes.

VMware Cloud Foundation Services consists of two families of services - Tanzu Runtime Services and Hybrid Infrastructure Services. Powered by innovations in vSphere 7 with Kubernetes, these services enable a self-service experience through Kubernetes APIs.

- Tanzu Runtime Services allow developers to build applications with freedom using the upstream conformant Kubernetes distributions.
- Hybrid Infrastructure Services allow developers to provision and work with infrastructure such as compute, storage, and networking.

vSphere Bitfusion		
Delivery of elastic infrastructure for AI/ML applications using cloud pools of hardware accelerators such as GPUs.		• (Add-on required) ¹
Distributed Resource Scheduler™(DRS) Redesigned with a more workload centric approach, DRS balances resources allocated to workloads in a vSphere cluster; versus the previously used cluster-wide deviation model; also resulting in an improved cycle time.		•
Storage DRS™ Automated load balancing now looks at storage characteristics to determine the best place for a given virtual machine's data when it is created and used overtime.		•
Distributed Power Management™ (DPM) Optimizes power consumption by turning off hosts during periods of reduced demand.		•
Storage Policy-Based Management Allows common management across storage tiers and dynamic storage class-of-service automation via a policy-driven control plane	•	•
I/O Controls (Network and Storage) Prioritizes storage and Network access by continuously monitoring I/O load of a storage volume and over the network, and dynamically allocating available I/O resources to virtual machines according to business needs.		•
Single Root I/O Virtualization (SR-IOV) Support Allows one PCI Express (PCIe) adapter to be presented as multiple separate logical devices to virtual machines. Allows users to offload I/O processing and reduce network latency.		•
